Cloud/DevOps Engineer

DevOps Engineer with seven years of experience building, automating, and supporting infrastructure and microservice-based platforms. Skilled in Python, Linux, Kubernetes, AWS, Azure, CI/CD, and GitOps, with a focus on reliable systems and simpler, faster deployments. Currently exploring AI agents, RAG pipelines, and local LLMs to speed up delivery and support work.

Professional Experience

Qualco Technology, Athens, GR Oct 2023 to Present

DevOps Engineer

As part of the Qualco DevOps team, I lead the DevOps engineering activities for the Qualco Supply Chain Finance platform, supporting enterprise banking customers across multiple regions.

- Designed and supported microservice-based architectures and Kubernetes-driven deployment workflows across AKS, OpenShift, Nutanix, and containerized environments, enabling scalable and consistent release processes across client infrastructures.
- Built and maintained CI/CD and GitOps pipelines using Jenkins, GitLab, Azure DevOps, Flux CD, and Argo CD, standardizing deployments across heterogeneous environments adapting to client needs.
- Reduced production deployment time from one working day to 30–40 minutes through pipeline optimization, deployment automation, and GitOps adoption.
- Led release planning and coordinated production deployments with QA and development teams, ensuring sprint readiness and controlled production rollouts.
- Developed automation tooling using Bash, Python, and JavaScript to streamline operational workflows and reduce manual intervention.
- Supported database migration using Liquibase and validated production readiness through Grafana k6 load testing.
- Implemented centralized secrets management using Azure Key Vault and HashiCorp Vault, strengthening security, compliance, and credential lifecycle management across environments.
- Worked closely with development teams supporting Java and Angular applications run on Tomcat, Apache, and Nginx.
- Delivered on-demand production support for critical incidents, including off-hours troubleshooting and resolution, ensuring platform stability. Partnered with engineering and operations teams across banking clients in the UAE, Saudi Arabia, Qatar, Jordan, and Greece to support deployments, production operations, and infrastructure delivery.

Skills: Linux, Jenkins, GitLab, Azure DevOps, Kubernetes, AKS, OpenShift, Nutanix, Docker, Podman, Flux CD, Argo CD, Istio, AGIC, Liquibase, Java EE/Servlet, Spring Boot, JavaScript, Tomcat, Apache, Python, Nginx, Grafana k6, Azure Key Vault, HashiCorp Vault

RocketX, Amsterdam, NL Oct 2022 to Oct 2023

Cloud/DevOps Engineer - Contract

As a member of an engineering team, I was involved in the "insourcing" and rebuilding of RocketX's Magnify Platform. I held the Cloud/DevOps role within the team.

- Took over Magnify from the external software house that had been building it, moving its code, infrastructure, and operations in-house so the team could develop it further.
- Migrated from Bitbucket to GitHub and created CI/CD workflows for all Magnify's repositories using GitHub Actions.
- Launched a Kubernetes cluster using AWS EKS to run the whole architecture, along with a CloudWatch monitoring dashboard.
- Designed and launched an Apache Airflow architecture to automate data ingestion from HubSpot CRM and several other sources.
- Automated SSL certificate renewal with cert-manager and secured the cluster with Datree.
- Developed two serverless APIs using AWS Lambda and API Gateway.
- Used Terraform and CloudFormation to create Infrastructure as Code (IaC) repositories. The first repository was created for managing two EKS clusters: one for the production environment and the other for the development and staging environments. The second repository was dedicated to managing the remaining AWS services, including VPCs and networking configurations, RDS databases, S3 buckets, Redis ElastiCache, and Lambdas.
- Led day-to-day system maintenance and operational tasks.

Skills: Linux, Python, AWS, Kubernetes, Airflow, GitHub Actions

Intracom Telecom, Peania, GR Mar 2022 to Sep 2022

Software Engineer - Contract

As a member of Ericsson's Deployment Unit (outsourced through Intracom Telecom), I worked on a six-month contract. The goal of our multinational team (Spain, India, Greece) was to virtualize clients' physical hosts and deploy Ericsson's Network Design and Optimization Platform (DOP, part of Ericsson Cognitive Software) on the newly launched VMs. I participated in two projects.

- Developed Ansible playbooks to automate the deployment of Ericsson Cognitive Software on client VMs.
- Carried out hands-on deployments of the platform for TIM Italy and ZAIN Iraq.

Skills: CentOS Linux, Python, Ansible, Hadoop Ecosystem, ELK, VMware, Docker

Deepsea Technologies, Athens, GR May 2020 to Mar 2022

Integration Engineer

- Developed an application programming interface (API) that enables seamless data integration between client ERP systems and an AWS RDS instance. Launched a mail server and implemented a scheduled mail parser to automate the real-time ingestion of email data.
- Containerized data engineering applications and internal tools, contributing to the company's "monolith to microservices" transformation.
- Developed and maintained Terraform scripts to automate 1) infrastructure setup of a "CloudFront & S3" hosted static frontend application, 2) EC2 creation and configuration dedicated to hosting internal tools and data processing microservices.
- Participated in day-to-day system maintenance tasks, primarily focused on maintaining the company's AWS cloud infrastructure and managing agents installed on clients' dedicated virtual machines.

Skills: Linux, Python, Flask, AWS, Docker, SQL

Earlier Experience Jan 2018 to Feb 2020

- **Technical Support at Cosmote, Athens** (Jul 2019 to Feb 2020): Provided 2nd-level B2B technical support, mainly on networking and VoIP issues.
- **Research & Development Intern at the University of Patras** (Jan 2018 to May 2019): Converted legacy C code for passive seismic data simulation to Python and MATLAB at the Patras Seismology Lab, and spent four months on image/video processing with Python and FFmpeg in Irida Labs' AI team.

Skills: Linux, Python, C, Networking, VoIP, Windows Server, Seismic Signal Processing, Image/Video Processing

Education

Web Engineering Oct 2019 to Sep 2021

Harokopio University, Athens, Greece

Postgraduate Degree, Grade: 9.48/10.0

Physics Oct 2013 to Dec 2018

University of Patras, Patras, Greece

Bachelor of Science, Grade: 7.11/10.0

Hobbies

Traveling, Board Games, Movies, Basketball, Combat Sports Nerd, Beer & Burger Addict

Indie Projects

Keycloak on GKE + Cloud SQL PoC ▪ GitHub Jul 2026

Built a 3-replica HA **Keycloak** cluster on **GKE** using modular **Terraform** and **Helm**, backed by private **Cloud SQL** over Private Service Connect, with managed TLS, tested Cloud Monitoring alerts for downtime and brute-force logins, and a sample **GitHub Actions** pipeline using Workload Identity Federation.

Spindaemon: A GPT-3.5 Viber Chatbot Feb 2023 to May 2023

Spindaemon is a chat assistant for Viber, utilizing OpenAI's gpt-3.5-turbo model. It rewrites your direct messages in a more professional style on the spot. It can also save your conversations and provide useful insights on your communication effectiveness. I built Spindaemon as a side project while part of the #indiehackers and #buildinpublic Twitter community.

Synthetic Vessel Trajectories Generation Platform Feb 2021 to Oct 2021

Developed a full-stack AI platform using **Python FastAPI** and **Vanilla JS** to generate synthetic vessel trajectories. Integrated **LSTM networks** for sequential route generation, a classical physics kinematics model, and **XGBoost regression** to predict localized kinematics, exposing the pipeline via high-throughput REST APIs and Leaflet.js for real-time visualization.
